**THE CORONERS ACT 2006**

AND

IN THE MATTER OF

An inquiry into the death of  
**JOHN RODERICK MCINNES**

Date of Findings:

23 October 2013

---

**FINDINGS OF CORONER H B SHORTLAND**

---

**Introduction**

[1] At approximately 8.10 pm on 25 September 2010, John McInnes was located deceased underneath his quad bike on his farm at Jubilee Road, Hikurangi. His son-in-law Michael Brown discovered him lying face down on the hilly slope in the cemetery block of the farm. The bike was taken off him and despite attempts to revive him he was deceased.

[2] Mr McInnes had arrived home at about 5.30 pm after working on his farm all day. He said to his wife that he was going to spray the cemetery block paddocks for carrot weed. He went out to his Yamaha Big Bear quad bike and filled the spray unit before coming back inside to watch the news.

[3] At 6.30 pm he left for the cemetery block paddocks. This particular block is best described as hilly with a slope of approximately 30 degrees. It's surface is uneven with ruts created over time by walking stock.

[4] Some time between 6.30 pm and 8.10 pm Mr McInnes has lost control of his quad bike whilst spraying on a hilly slope. It appears Mr McInnes has attempted to steer the bike up the hill in an attempt to manage the uneven surfaces (ruts).

[5] The bike has rolled 180 degrees landing on top of Mr McInnes with his head facing up the hill, his face in the ground and the quad bike coming to rest on his back.

[6] The inquest focussed on the circumstances leading to the death.

[7] From the outset of this inquest the Court acknowledges the McInnes family and their friends and support persons for the loss of Mr McInnes.

[8] Hayley Brown (daughter of Mr McInnes) gave evidence and an opinion as to how her father lost control of the quad bike ending up in the position in which he was found in. She was with her husband, Mr Michael Brown, when Mr McInnes was discovered.

[9] This inquest is part of a series of hearings which the Coronial Jurisdiction will carefully examine the circumstances surrounding the individual deaths, but more importantly to focus on what recommendations and comments can be considered in advancing the safety of quad bike use in New Zealand.

## **The Law**

[10] Section 57 of the Coroners Act 2006 sets out the purpose of an inquiry and the legal frame work for an inquest.

### **57 Purposes of inquiries**

- (1) A coroner opens and conducts an inquiry (including any related inquest) for the 3 purposes stated in this section, and not to determine civil, criminal, or disciplinary liability.
- (2) The first purpose is to establish, so far as possible,—
  - (a) that a person has died; and
  - (b) the person's identity; and
  - (c) when and where the person died; and
  - (d) the causes of the death; and

- (e) the circumstances of the death.
- (3) The second purpose is to make specified recommendations or comments (as defined in section 9) that, in the coroner's opinion, may, if drawn to public attention, reduce the chances of the occurrence of other deaths in circumstances similar to those in which the death occurred.
- (4) The third purpose is to determine whether the public interest would be served by the death being investigated by other investigating authorities in the performance or exercise of their functions, powers, or duties, and to refer the death to them if satisfied that the public interest would be served by their investigating it in the performance or exercise of their functions, powers, or duties.

[11] The main focus of this inquest is the circumstances of the death. Further recommendations arising from this inquiry will hopefully prove to be another positive step toward making the use of quad bikes safer.

### **The facts**

[12] John Roderick McInnes also known as Jack McInnes born 3 May 1946. He was 64 years of age at the time of his unfortunate death. He had farmed in the Marua district for 31 years. The property in which this tragedy took place was located at 910 Marua Road, Hikurangi. The property in question contained a cemetery block surrounding grassland paddocks of approximately five acres in total. At the time Mr McInnes was leasing this block of land for the purposes of grazing his stock.

[13] On 25 September 2010, Mr McInnes had spent most of the day involved in farming responsibilities. He returned home at about 5.30 pm and said to his wife that he needed to spray the cemetery paddocks for carrot weed.

[14] Mr McInnes owned a Yamaha Big Bear 4x4 quad motor bike. At the rear of the bike was a mounted spray unit a C-Dax 100 litre model with a collapsible spray boom attached.

[15] Mr McInnes filled the spray unit then came inside and watched the 6 o'clock news before informing his wife that he was off to spray the cemetery block paddock.

On the front of the quad bike he had a mounted fish bin in which he carried extra fluid.

[16] Despite being an experienced weed sprayer he had not sprayed on this block before with its 30 degree gradient slope.

[17] Mr McInnes had owned the quad bike for over 10 years and was considered very conscientious about ensuring that his equipment being in good condition. Any machinery he engaged and used on his farm would function and work appropriately. His family described him as meticulous about servicing his bike and his spray unit.

[18] He was considered to be an experienced quad bike rider although he had not attended any formal training or attended active riding courses. Nevertheless, those that knew him in his farming community said he was an experienced rider of a quad bike. Mr McInnes did his own maintenance on his bike and as previously indicated kept everything in good working order.

[19] On the evening of 25 September 2010 Mr McInnes was to join his wife; his daughter and son-in-law for dinner. As it was, he did not return for dinner and therefore his daughter Hayley and son-in-law Michael Brown went looking for him at about 7.55 pm. It was dark at that time so they focussed on looking for quad bike lights in the paddock as an indicator he was still working.

[20] Mr Brown said it was dark at the time as they made their way to the cemetery block. He parked at the top of the road and fully expected to see lights from the quad bike. Given there was no such sign he then jumped over the fence into the paddock to look for Mr McInnes.

[21] He found Jack McInnes face down on the ground with his head pointing up the hill. The quad bike was upside down and on top of half his body.

[22] Mr Brown said as follows:

**“I think the fish bin was in contact with his back. The bin was twisted, the quad engine was not going and the spray unit was still going. “**

[23] At that point Mr Brown grabbed the front of the quad bike and lifted it up and away from Mr McInnes' body. The bike rolled all the way down the hill.

[24] The boom then detached from the quad bike about half way down the hill.

[25] Mr Brown said that there was no signs of life and tried to sit him up before laying him on his back.

[26] Hayley Brown had gone to their neighbour Merv Rusk to ring the ambulance. Mr Rusk realising the seriousness of the situation provided what support he could and attended the scene and tried to resuscitate Mr McInnes without success.

[27] Mr Brown's view suggested Jack McInnes had sprayed most of the paddock before dealing with the steeper slope. The spray unit did not have baffles within it and therefore the liquid would move freely around the housing as the quad bike made its way around the paddock.

[28] Mr Brown further noticed that the quad bike was in a low ratio, second gear, which is considered very slow.

[29] What was most unusual was the fact that Mr McInnes was found face down in the slope of the hill with his head pointing upwards and the bike on top of him.

[30] Emergency services were called including the police. Mr McInnes did not respond to resuscitation and was declared dead at the scene.

[31] The quad bike was seized and then transported to secure storage for further examination.

### **Post Mortem and Toxicology reports**

[32] A post mortem examination was carried out on 26 September 2010 by Dr Emmanuel Lucio.

[33] Dr Lucio concluded that the direct cause of death was from mechanical asphyxia as a result of the quad bike falling on top of Mr McInnes.

[34] A standard toxicology test was carried out by ESR including the testing for alcohol; illicit drugs or medications that may have altered Mr McInnes' ability to ride the quad bike. There were no such traces.

### **Department of Labour**

[35] Mr Phillip Bailey, Health and Safety inspector with the Department of Labour attended the accident scene on 27 September 2010.

[36] Pursuant to s 17 Health and Safety in Employment Act 1992 Mr Bailey investigated the circumstances of Mr McInnes' death.

[37] In his report he identified several factors that had a contributing input into his untimely death. Those included the gradient of the hill measured with a slope meter showing approximately a 30 degree slope. In addition the surface was uneven as a result of stock walking the paddocks creating the ruts.

[38] Mr Bailey concluded from observing the wheel tracks on the slope that Mr McInnes has attempted to steer the bike up to the left and up the hill slightly to avoid the uneven surface (ruts). It was most likely the quad bike was starting to slip and lose stability.

[39] Somewhere in that action Mr McInnes has come off the bike and the bike has fallen on him down that slope.

[40] The bike was taken for an independent examination by a VTNZ vehicle inspector, Mr Lindon Griffiths in Whangarei. The report confirmed overall the vehicle was in good condition. Of particular importance, confirmation that both the steering and the suspension of the bike operated correctly.

[41] Mr Griffiths concluded there were no mechanical issues.

[42] The question arose as to whether the C-Dax 100 litre spray unit contributed to the cause of the death? This was a unit that was fitted around the back of the bike seat. Mr McInnes sitting in the normal riding position was cocooned by the mounted spray unit and two collapsible spray booms on the left and right hand side of the bike. The spray unit was operated by an independent motor.

[43] When Mr. Bailey went to inspect the vehicle he was unable to ascertain how much liquid was still in the containers. He was able to ascertain that on the front of the quad bike contained a fish bin that had a 20 litre container full of spray fluid and that was used to help weigh down the front of the bike.

[44] At the time Mr McInnes was not wearing a protective helmet.

[45] In concluding his report Mr Bailey found the main contributing factor to this death was the terrain.

[46] Mr Bailey says as follows:

**“Mr McInnes was in the process of boom spraying a hill that he had not attempted to boom spray before. He was travelling across the face of the hill which was rather steep in places and had an uneven surface due to cattle ruts.**

**It appears by the wheel tracks present that he has attempted to steer up the hill slightly and over these uneven surfaces (known as ruts).**

**The quad has rolled over 180 degrees, ejecting Mr McInnes who has landed face down on the ground with the bike coming to stop, landing on top of him.**

**Following the incident the ATV was inspected by a VTNZ vehicle inspector.**

**...it does not appear mechanical failure of the ATV was a contributing factor in this accident.”**

[47] Mr Bailey found the bike was in good condition and did not in any way contribute to this death.

### **Hayley Brown**

[48] Hayley Brown gave evidence at inquest and considered the situation and the circumstances leading to her father's death.

[49] She had time to reflect upon the scene and she was there with her husband when they found her father and it worked through her mind that reconstruction of the

events taking into consideration her father's meticulous views about keeping his machinery in good operating order and trying to look after his equipment.

[50] She thought it was very odd the way her father had been found, and the fact that he was trapped under the bike facing uphill.

[51] She noted that when her husband took the bike off her father the bike then rolled instantly all the way down to the bottom of the hill.

[52] It was her view that when her father was spraying the paddock the quad bike must have started to become unstable, therefore, he would have got off the bike and tried to hold the bike steady on the slope.

[53] As she said, knowing her father, he was meticulous about his equipment and wanted to ensure that nothing would happen to it.

[54] Therefore, she believes that whilst he was trying to hold the bike steady on the slope he has most probably lost his footing, fallen face down and the bike rolling on top of him.

[55] That would explain the unusual position in which he was found by Michael Brown and observed by Merv Rusk who followed.

[56] In summary, Mr. McInnes has got off the bike to try and steady it and maintain its stability on the slope. It has become too much for him and he has either lost his footing or his legs have given way to the weight of the bike and has fallen directly to the ground face down and the bike has come instantaneously over him and stayed there in that position.

[57] Hayley Brown made a profound comment about her father in that if had he observed a more self preservation approach to his safety he may still be alive today, although he may have his legs crushed or suffered some form of injury, nevertheless, he may well have been alive today.

## **Discussion**

[58] All the evidence provided including that of Mr Rusk indicates that Mr McInnes was an experienced farmer and had been using a quad bike for some

years. He owned this bike for over 10 years and kept it in excellent condition. He would do his own maintenance and ensure the bike was in good working order.

[59] On this particular evening he was conscientious about ensuring the spraying responsibilities were carried out and had organised himself to spray the cemetery block paddocks which he had not sprayed before.

[60] He set up his bike including the C-Dax 100 spray model which is mounted behind him followed by two booms on the left and right hand side of him. It had the effect of cocooning the rider.

[61] Constable Warren Bunn indicated it was fairly difficult to get in and out of that arrangement for an ordinary person.

[62] In my view, Mr McInnes knew his bike well and obviously was comfortable with the arrangement. He had owned the spray unit for over six years. He also didn't wear a helmet. Would this have made a difference? Possibly not.

[63] Somewhere between 6.30 pm and 8.10 pm when he was found he has lost control of his quad bike on the slope below Marua Road. The independent evidence of Mr Griffiths confirms there were no mechanical defects with respect to the quad bike. However, the terrain of the paddock as considered by the Department of Labour inspector, Mr Bailey' as a contributing factor given the ruts on the slope undermined the stability of the bike during the spraying operation.

[64] Hayley Brown in her thoughtful consideration has more than likely explained her father's actions leading to his ultimate demise.

[65] I agree with her view, It is more than likely the bike was starting to lose its stability on the hill and Mr McInnes has got off his bike to try and stabilise it. He has somehow lost his footing which has caused him to fall to the ground, face first with his head facing up the hill and the quad bike has followed crushing him where he was found in that position by Michael Brown.

[66] Given the unusual position in which he was found this seems the most feasible explanation.

[67] In my view, and in considering the dynamics of the bike, the slope and the riding position that Mr McInnes would have adopted, had the bike lost stability and started to roll down the hill then Mr McInnes would have been found in a totally different position most likely.

### **Formal finding**

[68] I am therefore satisfied on the balance of probabilities that John Roderick McInnes also known as Jack McInnes, 64 years of age at the time of his unfortunate death has died as a direct result of mechanical asphyxiation when his Yamaha Big Bear quad bike 4x4 has rolled on top of him and crushed him whilst he was spraying the cemetery block paddocks.

[69] This was a paddock he had not sprayed before and the 30 degree slope and the uneven surface have contributed to the instability of the quad bike which has crushed Mr McInnes.

[70] The circumstances of the death have been outlined in this decision.

### **Quad Bike Issues - Final Comments**

[71] I acknowledge the gathering of the expertise over 10 and 11 April 2013. This was a coming together of like-minded experts.

[72] I am grateful for the information and evidence provided by the cross section of expertise from the manufacturers and distribution representatives of the Motor Industry Association through to the farmers and agricultural industry leaders in health and safety. There were many other professionals and experienced leaders including educators and trainers with many years experience; academics and engineers who have provided their own source of independent research and information.

Lastly, I acknowledge the contribution of the Ministry of Business, Innovation & Employment ("MBIE" and formerly known as the Department of Labour) and the Accident Compensation Corporation ("ACC").

[73] At the end of the two day hearing I called for further submissions and received many from other knowledgeable individuals who were unable to attend

ranging from farmers, to health and safety consultants with expertise on farm machinery specifically the quad bike.

[74] I further acknowledge the overwhelming amount of information that has literally poured in relation to quad bike issues. That information forms the basis of these final comments.

[75] All these experts in my view had a common goal. Although they may have been from different sections of the spectrum of quad bike interest they unitedly wanted to advance the safer use of quad bikes in New Zealand (“NZ”).

[76] There is a plethora of issues surrounding quad bikes. These issues are complex in nature and despite discussion and robust debate the issues remain complex without resolution in some respects.

[77] In the NZ context, the quad bike has been in use for over 40 years. The quad bike has been the modern horse for the New Zealand farmer. The tractor and the quad bike have carried the load for farmers for many years.

[78] The early predecessor of the quad bike was a three-wheeler bike which in very early terms proved to be a dangerous machine.

[79] Evident during the hearings were the reasons why quad bikes are so popular amongst farmers. They are versatile and provide many options for the modern-day farmer. They perform a multiple range of functions in relatively quick time and are perceived by farmers to be a cost-effective piece of machinery. They are responsive and considered efficient in terms of time management. They continue to bare heavy loads through towing trailers; carting spray units; and they have the distinct ability to go places where other machinery are perceived not to go.

[80] The quad bike maybe considered to be a farmer’s best friend and their worst enemy.

[81] They have definite advantages over other machinery (tractors) and they equally have clear limitations. Various commentators state the humble quad bike is often pushed beyond its design capabilities. At inquest this comment was reiterated a number of times.

[82] I have observed from this inquest and the other hearings a farmer's safety is seriously compromised when the strict safety guidelines of a quad bike are compromised when used beyond their capability.

[83] Mr. John James, a professional trainer and educator of quad bikes and other machinery best described the quad bike as "Error intolerant". This is an apt description.

[84] These bikes are prone to rolling and tipping in a range of circumstances from riding at speed to going very slowly; over hilly slopes to undulated ground where the quad bike has been compromised in terms of its stability by the decision making process of the rider. This also gives rise to issues about design.

### **Manufacturers Views**

[85] Manufacturers have been very clear about the strict parameters in terms of the maximum weight limits and the use of after-market attachments including purpose-built trailers and spray machines.

[86] However, the most debated issue is that of crush protection devices (CPDs) or roll over protection devices (ROPs).

[87] Quad bikes are known to have a high centre of gravity; a short and narrow wheelbase and have tyres on the bike that require accurate pressure levels. They also require a high level of maintenance to maintain efficiency.

[88] Mr Clive Hellyar and Mr David Crawford, the former CEO and current CEO respectively of the Motor Industry Association, confirmed in their collective evidence quad bikes are designed to be ridden actively. They require "active riding". Quad bikes are essentially a four-wheel motorbike which requires good maintenance and especially accurate tyre pressure at the correct psi levels. They endorsed the importance of wearing a helmet. The issue of helmets will be further discussed in this section.

[89] Mr. Crawford confirmed the fact quad bikes had limited scope in their abilities. This was reiterated further by Mr. Paul Stewart who over 40 years has

been a quad bike mechanic; a quad bike training manager; and has represented the New Zealand distributors of quad bikes.

[90] In his view the distributors of quad bikes have always taken the proactive approach to safe use and rider training of quad bikes as a priority. In his view active riding and rider training was an essential part of ensuring the safe operation of a quad bike. It also formed part of the after sale service.

[91] The quad bike is unique. There is no other bike like it with features like the throttle found on the right-hand control; a single seat; a hand-operated front brake lever and a hand-operated rear brake lever with a right-hand foot brake lever. The quad bike allows a rider to stand up in certain circumstances which lowers the centre of gravity.

[92] The design and shape allows a rider to be active in moving their body weight around the bike where it is required.

[93] Mr Stewart confirmed that quad bikes primarily were designed for the recreational market. Every quad bike user needed to understand the manufacturer's guidelines.

[94] I was satisfied during the gathering of information that New Zealand distributors are very thorough in their after sales service to clients.

[95] The primary sale from a distributor to the first user included active riding training; a thorough instruction of the operation manual; an understanding of the quad bike's capabilities; and the importance of wearing a helmet. After sale, the distributors would ensure that their purchaser (often a farmer) had a follow-up visit in terms of a review of the above

[96] Unfortunately, these inquests highlighted the need for similar training for users of quad bikes when they maybe the second, third or ninth owner of the same bike. When they are on-sold, unless it is through a dealer or distributor, the likelihood of the same instruction and training is extremely remote and probably zero. There was no evidence the five fatalities in these hearings had any level of similar training.

[97] The best example in NZ would be a weekend warrior purchasing a quad bike from the online “Trade Me Auction site” for the purpose of riding round their property or taking it to a beach with an expectation that all they had to do was turn the key and play with it until they could ride it properly. That is a most common scenario and a recipe for potential disaster.

[98] I reiterate Mr Stewart’s final submission where he summed up what he thought was most important regarding quad bike use and that a quad bike requires a rider to make good decisions, to apply common sense and to realise that a quad bike has limitations. It is important to have good training to understand the reasons why the bike must be ridden actively and to adhere to the manufacturer’s guidelines with the use of wearing a helmet would make for safer use overall.

### **Ministry of Business, Innovation & Employment**

[99] Quad bike safety is part of the overall health and safety message in the agricultural sector.

[100] The sector is made up of a number of stakeholders all with a serious interest from health and safety; to efficient operation of the farming unit; and to policy making and oversight. The Ministry of Business, Innovation, and Employment (MBIE) drive the policy required to reduce injuries and fatalities around quad bike use.

[101] MBIE as a regulator has the role of enforcement and to prosecute where appropriate. I sense their preference would be to work side by side with end users in the sector as opposed to total enforcement. That is not to say that in some cases enforcement and prosecution maybe the only viable option.

[102] Part of their philosophy is not to coerce safer quad bike use by way of enforcement only. They rather encourage individuals to empower themselves to take personal accountability for their actions and those who they are responsible for. Therefore, the emphasis is on greater personal accountability for quad bike users.

[103] MBIE have been proactive in developing programmes to reduce fatalities and injuries overall.

[104] Evidence from ACC also showed they have been active in this area as part of their core business.

[105] MBIE in 2011 introduced “The quad bike harm reduction project”. The project was targeted to challenge unsafe quad bike use on farms in NZ.

[106] In my view it has been a successful project which has now become a building block for further development. New Zealanders know, the kiwi farmer is known to be stoic in their approach; self assured on their own opinions and stalwart on how their farms should be run. They often don't take change very well. These views and attitudes are often shaped by financial limitations or hardships; the affordability of resources; and uncontrolled variables like the weather and natural disasters. Despite the challenges MBIE have committed resources and policy to lift the bar on safe use of quad bikes on NZ farms.

[107] One of the successful outcomes of this project has been the increased use of helmets for quad bikes. There are a number of purpose-built quad bike helmets under NZ standards now available for users based on farmers' pragmatic needs. One of the problems why farmers do not wear helmets other than the fact it did not look good; was that they often could not perform some of their core functions like working the dog; being able to hear when moving stock; adaptable to weather demands; and realising whether there was any real benefit in using them.

[108] The project has shown there has been a marked increase in the use of helmets after a slow behavioural change. The use of helmets is one of the key messages.

[109] The original project was set for a two year period to end on 31 October 2013. The Court heard that given the perceived success and progress of the key indicators the programme has been extended. There are a number of factors contributing to the success. The dual approach of education followed by enforcement has been a clear indicator.

[110] The other has been the development of innovative ideas derived from the trans-Tasman relationships at government levels and with academic researchers involved in innovative research. These collective and ongoing developments have provided further positivity and support for the continuation of the programme.

[111] In the *Quad Bike Safety News*, June 2012 produced by MBIE, it was reported that the 2012 campaign saw more than 400 farmers across New Zealand visited by health and safety inspectors. That resulted in 67 repeat visits and at the time the Department of Labour (MBIE) had issued 189 written warnings and enforcement notices for issues like helmets; training; the carrying of passengers; towing; rider age and loading and fractions on the quad bikes.

[112] The same news reported that in the Taranaki region, there was an independent farming group that commenced regular meetings on health and safety issues including overwhelming support for the wearing of quad bike helmets.

[113] To summarise MBIE's position, they had four key messages which I endorse.

[114] There are four safety steps to consider; firstly, riders of quad bikes must be trained and experienced enough to do the job as required. To ensure the right vehicle is used for the right job. That makes reference to ensuring that the quad bike is not used beyond its capabilities. It may mean using other vehicles whether it is a side-by-side vehicle or a tractor. To always wear a helmet and to stop kids riding adult quad bikes.

[115] Whether quad bikes are used on farms or in a recreational setting it is important the quad bike safety message was transparent and clear.

[116] The second message MBIE promote is that farms are workplaces and therefore the Health and Safety in Employment Act 1992 furnishes legal responsibilities on farmers and their workers to comply with the Act and work safely. That includes the use of quad bikes and other machinery by employers and staff.

[117] I note the evidence of Jeanette Maxwell, National Board Member for Federated Farmers and spokesperson for health and safety highlighted there sometimes can be confusing messages on the interpretation of the Act. In her view it was understood by farmers that when they rode down to the letterbox to pick up their mail they did not need to use a helmet because they were not in a work phase. However, if they went from the letterbox to another part of the farm to check on stock that constituted work and therefore required to comply with the provisions of the Act. The point being clearer messages were needed.

[118] In my view pragmatism and common sense has been a feature of farming for many a long year there should be no issue on whether a helmet should be used or not.

[119] If engaging the quad bike in any activity there is always the possibility the bike could roll or flip given the well documented problems both in New Zealand and Australia whether it be at speed or low speed. On that basis the use of a helmet would be warranted in every situation.

[120] The third issue that MBIE seek endorsement is for the rural sector and communities associated with farming to stand up and take the leadership or ownership of the health and safety issues including quad bikes without the threat of enforcement of the regulators and prosecution.

[121] Human nature has shown that proactive leadership will always win the test of longevity in terms of success as opposed to coercion or compulsion. Self initiation has more long-term value in the end.

### **Roll Over Protection Devices**

[122] The last issue and perhaps the most controversial of issues is the use of roll over protection devices (ROP's) or crush protection devices (CPD's). This inquest and the evidence provided by the experts confirmed that there is a diverse range of opinions. The debate is both robust and lengthy. There is a clash of scientific evidence followed by polarised views as to whether ROPs provide safety or undermine safety on a quad bike.

[123] There is a "Mexican standoff" between the competing factions and most recently the competing science.

[124] This debate has been raging for some years and over the last two or three years there has been a direct challenge to the science provided by manufacturers over the use of ROPs.

[125] The essential argument by manufacturers is that the fitment of ROPs or CPDs can undermine the stability of the quad bike which places the rider's safety at risk. The counter argument by the others (which include academics; independent engineers; farmers; and agricultural technology innovators) is that the unchanging design of the quad bike has led to a belief that a farmer or rider of a quad bike would be safer with an appropriate ROP. Countless injuries and fatalities support that view.

[126] The manufacturer's evidence which has been formulated from a testing regime based on computer driven simulation has now been directly challenged by Australian authorities such as John Lambert; Geoff McDonald and Professor Tony Lower in their respective areas of expertise.

[127] That information has been shared with NZ by way of the trans-Tasman relationships.

[128] MBIE form part of the trans-Tasman working group process in trying to provide clear resolutions around the issues of design improvements for quad bike safety with specific reference to ROPs. Unfortunately the trans-Tasman group struggle to reach consensus due to the polarised views of the members.

[129] Nevertheless, the process did succeed in gaining a general consensus about the methodological limitations of research commissioned by the quad bike manufacturers indicating that ROPs most likely would cause more injury than prevention. That has been the established position, unchanged, for many years by the quad bike manufacturers.

[130] MBIE confirmed in their submissions the watershed moment was achieved when the trans-Tasman specialist technical group called into question the validity of the manufacturer's findings. Specifically, the manufacturer's research had previously dominated the ROPs debate claiming to have the only empirical evidence on the effectiveness of ROPs.

[131] What MBIE say from their involvement in the trans-Tasman technical group is that the group now has an overall consensus that perhaps ROPs are not as bad as they have been made out to be.

[132] The current position by the NZ regulator taken from their submission is this;

**“Various ROPs have been designed and fitted to quad bikes over the past two decades with the aim of protecting the rider from being crushed by the weight of the quad bike.**

**Quad bike manufacturers say that ROPs increase the chances of injury if a quad bike rolls and commissioned a computer simulation study to illustrate this effect. However, the validity of the study’s findings has been challenged by others citing contradictory evidence and the debate continues.**

**The Department (MBIE) cannot promote or require the fitting of ROPs to manage the hazard of quad bike roll over until the protective properties of such devices have been firmly established.**

**Fitting ROPs to a quad bike therefore remains a matter of personal choice for the farmer. A recent survey indicates that some form of ROP is fitted to quad bikes on approximately 15 percent of New Zealand farms.”**

[133] At inquest the issue was put to Mr Barton representing MBIE. He confirmed MBIE had no real choice other than to take the neutral position as the status quo notwithstanding future compelling evidence that would persuade the regulator differently. There is developing evidence in Australia now challenging the manufacturer’s science.

[134] NZ should be looking to the Australian landscape where ROPs have been fitted to quad bikes in the Federal government employment programmes and similarly in the NSW state government employment programmes. The quad bikes have been fitted with a proven commercial product deemed by the federal and state employers, endorsed by national health and safety entities, as an appropriate safety measure for their employees. I am aware a similar situation exists in Israel where ROP’s have been fitted to government quad bikes for over 10 years.

[135] It is important to distinguish the fitment of ROPs on Government quad bikes was done in their capacity as employers as opposed to an initiative by regulators.

[136] The Australia example has shown there has been genuine work towards addressing the issues surrounding the fitment of ROPs. Federal Minister, Mr. Bill

Shorten had led the charge on behalf of the Federal Government bringing together key stakeholders in terms of a review on the issue.

[137] It was my impression the Federal Government was potentially considering a legislative change in terms of the fitment of ROPs.

[138] In my view the Australian example which is being closely monitored by credible researchers like Professor Tony Lower and independent engineers including John Lambert and Geoff McDonald will provide the empirical evidence within the next 5 to 10 years showing that the fitment of appropriate ROPs will indeed reduce injury and fatalities.

[139] I believe this evidence in time will form the new bench mark science.

[140] In the NZ context there is a belief that at least 15 percent of quad bikes used on farms have a fitment of some sort. The perception is the farmer considers their choice of ROP as appropriate to their work demands.

[141] The inquests have shown there is a real variety of ROPs in NZ which may be best described "the good, the bad and the ugly".

[142] Dr David Moore who is considered in NZ and Australia as a credible academic and analyst of quad bike issues confirmed at inquest that not all ROPs were bad and in some situations an appropriate fitment would add safety.

[143] The clear message coming from the inquest is that there is a fine balance between an appropriate ROP and maintaining the stability of the quad bike given its limitations and error intolerance.

[144] Therefore the fitment of ROPs remains an independent and individual decision of a quad bike user. There are a range of ROPs available both on a commercial basis and individually developed designs by farmers who apply the "Number 8 wire" philosophy in a design that works for them.

[145] I take the view there is a strong argument that ROPs should be considered as a legitimate form of safety protection. Unless there is a fundamental shift in the design of quad bikes; that lowers the centre of gravity; that make the base of the

bike wider; and maybe a new manufacture enters the market with a new and a safer design; then the “Mexican standoff” remains in terms of the polarised views.

[146] It is not for this finding to endorse commercial products and name them individually; nevertheless, there are at least two on the market that have independent endorsement and merit and have proven to be an added safety feature without compromising the safety of the bike through independent testing and not by simulation testing. They are not perfect but they are more likely to save the life of a rider when it is tipped than not. Again, it comes back to the individual’s view on the spectrum of whether ROPs should be standardised as a fitment or not.

### **Training and Education**

[147] Most importantly as an immediate and long-term factor in quad bike safety is the issue of education and training.

[148] I was impressed with the industry leaders in terms of their dedication and commitment whether they were manufacturers or industry educators on ensuring that those who use quad bikes understood the limitations and capabilities of the bike; the issues around good maintenance and functionality of the bike; the use of helmets; the importance of active riding and the reasons why it is done; that inherently quad bikes are error intolerant; the importance of understanding the manufacturer’s instructions and capacity weight tolerance when towing trailers or adding weight by way of spray machines and specifically understanding the importance of that safety aspect.

[149] There was a realistic acknowledgement, not directly, more from the understanding these types of bikes had unique design features and therefore they needed to be used as safely as possible. Training and education remains an integral part of the safety message.

[150] Over the years subsequent governments have funded or subsidised training and education programmes in quad bike use. The industry genuinely believed such programmes increased greater safety awareness adding real value to the agricultural industry and the Forestry industry.

[151] There were concerns by industry trainers the removal of Government subsidies would undermine the sector standards. The industry has tried to maintain a high standard of training and overall education established some years earlier. Their concern is the removal of the financial subsidy will undermine both the quality and effectiveness of the outcomes desired.

[152] I was impressed with the clarity of the message and whilst there may be a small element of self interest, overall, the message promoted to quad bike users was one of safety first above all else.

[153] With the complexities of design and associated arguments around it, the most pragmatic way of dealing with a quad bike on a day-to-day basis is through good education and training.

[154] Grant Hadfield, of FarmSafe NZ, reiterated the importance of skills-based training that included hazard identification and the management of that hazard. In applying the skill based principles to the use of quad bikes, it is making the rider of that bike personally responsible for their own safety. It is a lifelong responsibility when engaging quad bikes.

[155] With an estimate of between 80,000 and 100,000 quad bikes in use throughout NZ in various situations from commercial farming through to recreational use, one can imagine the variance in riding skill levels; the variance in maintenance standards; and general attitude to safe use. The variance would span from exceptional to total neglect and worse.

[156] It would be easy to suggest there should be a minimum standard of bike maintenance or riding skill and therefore a regulatory licensing and registration regime should be set up for quad bike and riders, as with motorbikes, as with other machinery. In terms of a business plan with enforcement provisions that would be very difficult to establish requiring political motivation.

[157] I like the concept of the "FarmSafe Quad Bike licence" where a farmer; farmer's employee; self contractor or a quad bike user is trained and taught to be competent when using a quad bike. The training includes understanding the hazards of using quads; and the importance of good quad bike maintenance.

[158] FarmSafe stated 68 percent of quad bikes fail mechanical checks. It is a skills-based training course that to date had seen 350 quad bike licenses issued in NZ since 2011.

[159] The concept has real merit and regardless if the quad bike user stayed with the same employer or moved to somewhere else it would be a qualification/licence that would be recognised within the industry. There is discussion of expanding the concept industry wide to a "Rural Licence"

[160] Overall, I would endorse the continuation of training and education in this area. In my view it is the most pragmatic safety measure that would have the most use over the longest period of time.

### **Retention of Expertise**

[161] At inquest, Dr. Moore, highlighted the need to accumulate and retain genuine and credible knowledge around quad bike use; safety and other appropriate evidence associated with it. He felt there was not enough expertise or overall knowledge being built up. There needed to be more collection and analysis of the contributing factors to both injury and death. There needed to be a building up of sector and technical knowledge.

[162] He felt the sector wasn't retaining the people with the sector and technical knowledge. There were too few people involved in key positions in the analytical and regulatory bodies and often they changed roles too frequently resulting in failure to retain the knowledge and the people who could make a difference.

[163] Dr Moore reiterated that New Zealand was not a separate case in that we were in a similar position to that of Australia, Sweden and other countries having the same debates and challenges. Other countries were struggling with improving health and safety standards in the issues around quad bike safety and the agriculture sector in general.

[164] In summary, he acknowledges that New Zealand was not a wealthy country overall and therefore would never be able to afford a health and safety system for agriculture modelled on the aviation or petrochemical sectors for an example which

had large expert teams of regulators developing and updating rules; policies and procedures.

[165] He felt that we should adopt a different model in New Zealand to harness the energy and specialist knowledge of individuals in this industry but particularly around quad bike use. I support that sentiment.

## **ACC**

[166] I acknowledge the work ACC have been doing in education and training. They have been at the forefront of funding research on helmet use and other factors. They have funded Standards New Zealand to develop specific helmets for quad bikes and have been working with companies both here in NZ and overseas (including Australia) to further the safety message around quad bike use. They remain active in the area of quad bike injury reduction and remain committed in providing media developed resources around keeping children safe around quad bike use.

[167] I endorse their continued involvement in the New Zealand community working with various groups including “Kidsafe” and others in providing the overall education and clear message about sensible use of quad bikes.

[168] Moving forward into the future ACC will play an important role in monitoring the scientific development of new evidence in its role of reducing injury; risk; and fatalities from quad bikes. ACC is also challenging the science around ROP’s and continues to work and fund other researchers with similar views.

## **Testing of Aftermarket products**

[169] There is a need for more information around the testing of after-market products that can be fitted or attached to a quad bike. Specifically, I talk about the use of spray units and the impact they have on the stability of a quad bike when in use. The same would apply to the attachments of trailers or purpose-built trailers.

[170] In all five inquests the common denominator was an after-market attachment either a spray unit or a trailer that contributed to the overall demise of each crash and eventual death.

[171] Dr Moore talked about having baffles in the spray unit tanks to stabilise as much as possible the shifting liquid. He talked about better research on the coupling flexibility of purpose built trailers towed by quads etc. There is a genuine lack of available research on these aftermarket products and the impact they have on the stability of the quad bike. This in itself would form part of the knowledge build up.

[172] There is very little scientific feedback on the impact these after-market products have. Whether they are provided by the manufacture or an industry leader which has the ability to widely publish such information, in my view is required.

## **ATV**

[173] Two final points for consideration; firstly, the term "ATV" in my view should be removed from any official description of a quad bike. Manufacturers explain the term ATV has been around for many years and was a distinguishing tag attached to a quad bike and easy to be identified in the market place.

[174] In today's context, the all-terrain vehicle (ATV) is simply not that and should not be referred to as it is misleading.

[175] In many of the quad bike fatalities in which Coroners have dealt with there has been a common result where the deceased has often been trapped under their quad bike for some period of time. They have survived for a period before succumbing to the weight of the bike or the sustained injuries. The carrying of a personal alarm of some sort may lead to saving a life. I would invite the innovators to consider the concept.

[176] Farmers work hard; often in isolation; over long hours; often battling fatigue and tiredness; having an alarm system or communication system that can be activated relatively easily could save a life especially if rescuers are searching and time is of the essence.

[177] Lastly, other Coroners have raised in their findings the use of a mechanical beeper of some sort when the bike is being reversed. It gives a busy farmer who is often on and off their bike all day a warning when in reverse. There have been cases when a rider has reversed backwards over a cliff when they genuinely

thought they were in gear to move forward. Is this something the innovators may consider as well?

[178] The same principle could apply by way of engineering intelligence when the quad bike is at risk of rolling over because of unstable terrain; or when it is been ridden across an unsafe hilly slope. It tells the rider to immediately alter their course or to stop. That is a discussion and a suggestion requiring further involvement from industry leaders and innovators.

### **Eliminate Quad Bikes from Farming**

[179] The other consideration is to stop using quad bikes in farming altogether. There have been projects examining this concept in both in Australia and NZ on large commercial operations. Many NZ farmers are transferring from quad bikes to UTI's or side-by-side all terrain vehicles. The two wheel motorcycle is considered safer to use accepting it is very limited in playing multiple roles. There is the rise of small vehicles with a genuine utility role.

[180] The fact remains the quad bike is entrenched as a vital farm tool in NZ.

### **Recommendations**

- (a) I indorse the programmes and projects MBIE have instituted in relation to supporting guidelines for the safe use of quad bikes;
- That riders must be trained and have the requisite experience to ride a quad bike in performing their duties and functions.
  - To ensure that proper judgement is exercised in choosing the right vehicle for the right job.
  - To always wear a helmet.
  - To prevent children riding adult quad bikes.
- (b) That a quad bike should not be referred to as all-terrain vehicle (ATV). It is accepted the acronym ATV was associated with the

marketing of quad bikes over many years and has been an accepted term within the quad bike/motorcycle industry. In my view it is misleading and to remove it from Government terminology in relation to quad bikes is appropriate. Quad bikes should be identified by their true definition and not a misleading definition like ATV.

- (c) I endorse the recommendation by all heads of the industry in that a helmet should be worn at all times when a quad bike is in use.
- (d) I strongly recommend the continuation of training and education with the tertiary sector in relation to NZQA to review appropriate levels of funding in ensuring that appropriate training which would include skills-based training; hazard identification and management; the understanding of appropriate maintenance including tyre pressure on the quad bike. Training and education would include a thorough understanding of the limitations and frailties of the quad bike particularly when after-market attachments like spray units and trailers are attached to it.

Unfortunately, training and education cannot teach common sense or good judgement; nevertheless, they can teach the realities of poor decisions when quad bikes are placed in vulnerable situations as a result of riding them on hilly; sloped or steep terrain. Death and injury can also occur when in slow motion or when turning.

Active riding is one of the most important skills required to safely control a quad bike and must be taught by qualified people.

Making training of quad bikes as accessible as possible not only for corporate units within the agricultural industry; to those in the recreational industry; to those in forestry and other related industries would benefit from a similar type of training.

Whether there is an opportunity to discuss a certification or licensing option would be worthwhile pursuing.

- (e) I suggest consideration be given to supporting a multi-disciplinary taskforce to specifically research and advise on ROPs. As it stands, there is a trans-Tasman group who consider design issues and ROP's etc. The evidence at inquest has shown there is a diverse range of opinions that are entrenched and therefore the issue of safe fitment of ROPs cannot be advanced. This group has adjourned from time to time due to the entrenched positions. Therefore a dedicatory group of professionals within the New Zealand Government regulator set up is worth considering. It may even fit within the new standalone entity.
- (f) ROPs: in continuing this area I endorse the view of closer relationships with Australia and to look to their developments both at the Federal and State Government levels with the fitment of ROPs and to closely monitor the success that comes from their development and further evidence provided by independent engineers and health and safety experts.

To provide further support to ACC in their endeavours to fund more research in joint projects and to continue to develop advanced scientific approach's to reducing risk; harm and fatalities relating to quad bikes.

Further consideration should be given to a specialist unit for quad bikes, tractors and farm machinery. As pointed out by Dr. Moore there is a problem in retaining the technical and sector knowledge and the personnel who have built up expertise over time. To have a dedicated unit not just around quad bikes but other farm machinery would greatly assist the agricultural sector and other similar industries. It may be worth pursuing consideration of a joint venture between industry leaders and the New Zealand Government.

- (g) To have regular testing of after-market attachments and products associated to quad bikes specifically trailers and spray units. To provide better information around risk and compromise in relation to the stability issues of a quad bike. To provide better understanding of

limitations and to provide a better and safer message within the industry.

- (h) To give thought to a better message about quad bike maintenance, in particular having the correct tyre pressures and general maintenance of the quad bike reducing risk and potential fatalities – training and education.
- (i) Lastly, recognising quad bike issues are complex in many aspects. Maintenance remains a genuine problem and a contributing negative factor to injuries and fatalities. In the ideal world having quad bikes either registered or licensed or warranted may be of real benefit. Is there any merit in considering this issue?
- (j) To consider fitting a warning signal by way of a beeper or alarm when a quad bike is in reverse or when it is on a slope and potentially at a point of tipping. Whether the issue of artificial intelligence can be attached to a quad bike for safer use is both an academic and technical discussion. It is accepted these are but discussion points that with the right political will and physical environment may become a reality.

---

Coroner H B Shortland
